Why not simply more FC Layers?

We cannot make networks arbitrarily complex

- Why not just go deeper and get better?
 - No structure!!
 - It is just brute force!
 - Optimization becomes hard
 - Performance plateaus / drops!

Better Way than FC ?

- We want to restrict the degrees of freedom
 - We want a layer with structure
 - Weight sharing → using the same weights for different parts of the image

Image Filters

- Each kernel gives us a different image filter

Edge detection

$$\begin{bmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & -1 \end{bmatrix}$$

Convolutions on RGB Images

width height depth

image $32 \times 32 \times 3$

Depth dimension *must* match;
i.e., filter extends the full depth of the
input

filter $5 \times 5 \times 3$

Convolve filter with image
i.e., 'slide' over it and:

- apply filter at each location
- dot products

Images have depth: e.g. RGB \rightarrow 3 channels

Convolutions on RGB Images

$32 \times 32 \times 3$ image (pixels \mathbf{X})

$5 \times 5 \times 3$ filter (weights vector \mathbf{w})

1 number at a time:

equal to dot product between filter weights \mathbf{w} and $\mathbf{x}_i - th$ chunk of the image. Here: $5 \cdot 5 \cdot 3 = 75$ -dim dot product + bias

$$z_i = \mathbf{w}^T \mathbf{x}_i + b$$

$(5 \times 5 \times 3) \times 1$

$(5 \times 5 \times 3) \times 1$

Convolutions on RGB Images

$32 \times 32 \times 3$ image

$5 \times 5 \times 3$ filter

Slide over all spatial locations \mathbf{x}_i
and compute all output \mathbf{z}_i ;
w/o padding, there are
 28×28 locations

Activation map
(also feature map)

Convolution Layer

Convolution Layer

with different weights!

Convolution Layer

Convolution "Layer"

$32 \times 32 \times 3$ image

Activation maps

Let's apply **five** filters,
each with different weights!

Convolution Layer

- A basic layer is defined by
 - Filter width and height (depth is implicitly given)
 - Number of different filter banks (#weight sets)
- Each filter captures a different image characteristic

Different Filters

- Each filter captures different image characteristics:
 - Horizontal edges
 - Vertical edges
 - Circles
 - Squares
 - ...

$$N = 7, F = 3, S = 3: \frac{7-3}{3} + 1 = 2.\bar{3}$$

Fractions are illegal

Convolution Layers: Dimensions

Shrinking down so quickly ($32 \rightarrow 28 \rightarrow 24 \rightarrow 20$) is typically not a good idea...

Convolution Layers: Padding

Why padding?

- Sizes get small too quickly
- Corner pixel is only used once

Convolution Layers: Padding

Image 7×7 + zero padding

0	0	0	0	0	0	0	0	0
0								0
0								0
0								0
0								0
0								0
0								0
0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0
0								0
0								0
0								0
0								0
0								0
0								0
0	0	0	0	0	0	0	0	0

Input ($N \times N$): 7×7

Filter ($F \times F$): 3×3

Padding (P): 1

Stride (S): 1

Output 7×7 

Most common is 'zero' padding

Output Size:

$$\left(\left\lfloor \frac{N+2 \cdot P-F}{S} \right\rfloor + 1 \right) \times \left(\left\lfloor \frac{N+2 \cdot P-F}{S} \right\rfloor + 1 \right)$$

$\lfloor \rfloor$ denotes the floor operator (as in practice an integer division is performed)

0								0
0								0
0								0
0								0
0								0
0								0
0								0
0	0	0	0	0	0	0	0	0

Types of convolutions:

- Valid convolution: using no padding
- Same convolution: output=input size

Set padding to $P = \frac{F-1}{2}$

Convolution Layers: Dimensions

Example

Input image: $32 \times 32 \times 3$

10 filters 5×5

Stride 1

Pad 2

Depth of 3 is implicitly given

Output size is:

$$\frac{32 + 2 \cdot 2 - 5}{1} + 1 = 32$$

i.e. $32 \times 32 \times 10$

Remember

$$\text{Output: } \left(\left\lfloor \frac{N+2 \cdot P - F}{s} \right\rfloor + 1 \right) \times \left(\left\lfloor \frac{N+2 \cdot P - F}{s} \right\rfloor + 1 \right)$$

Convolution Layers: Dimensions

Example

Input image: $32 \times 32 \times 3$

10 filters 5×5

Stride 1

Pad 2

Output size is:

$$\frac{32 + 2 \cdot 2 - 5}{1} + 1 = 32$$

i.e. $32 \times 32 \times 10$

Remember

$$\text{Output: } \left(\left\lfloor \frac{N+2 \cdot P-F}{s} \right\rfloor + 1 \right) \times \left(\left\lfloor \frac{N+2 \cdot P-F}{s} \right\rfloor + 1 \right)$$

Convolution Layers: Dimensions

Example

Input image: $32 \times 32 \times 3$

10 filters 5×5

Stride 1

Pad 2

Number of parameters (weights):

Each filter has $5 \times 5 \times 3 + 1 = 76$ params (+1 for bias)

-> $76 \cdot 10 = 760$ parameters in layer

- You are given a convolutional layer with **4** filters, kernel size **5**, stride **1**, and no padding that operates on an RGB image.
- Q1: What are the dimensions and the shape of its weight tensor?
